Details:

IAV’s first ETA conference will bring together experts from research and development and from various fields (transport, industry and building engineering) to discuss the latest technological developments and applications for energy efficiency. ETA 2016 will expand the range of topics at the previous IAV thermoelectrics conference and focus on the main topic areas of:

- Energy and thermal management
- Air conditioning
- Waste heat recovery

The conference is aimed at representatives of the international automotive industry, academic experts and professionals in industries – such as household appliances, rail or aerospace – that also benefit from efficient energy use.

Based on this interdisciplinary approach, ETA 2016 will create a platform to share recent research findings, technologies and
best practices. The conference addresses an international audience and is therefore an ideal opportunity to find out about developments in other markets.

We hope to receive a critical and interesting selection of application-oriented contributions in these areas, focusing on the following areas and foregrounding their technical realization:

• Concepts and components
• Processes
• Simulation and regulatory approaches

Whether as a speaker or exhibitor, we look forward to receiving your proposed topic for ETA 2016, which will be held at the Ellington Hotel in Berlin.
